

Ligation of large
arteries

Carotid can best-
be tied about the
middle. Can make
pressure ^{external} so veins will
show plainly.

When get down to
sheath will get
pulsation.

Pick up the sheath
and make small open-
ing enough to admit
Annerism needle.

Best to tie the artery
twice and then cut
the artery.

Arteries have been
tied for epilepsy.

Subclavian sometimes
before an amputation
first cut down onto
the clavicle

The brachial in
median line inner
border of biceps

When wound in hand
can enlarge the wound
and hunt some
time for the vessel
or tie above

The external iliac
cut down to the perito-
neum and then
crowd that aside
what structures avoid
